

EXTRACTION DUCTS

Extraction Ducts (Return air)

Extraction systems are also used as return systems, this means, when we inject air into a room, we must ensure its exit to maintain a balance in the system. This system is designed based on the type of pressure required.

The system works as a conductor or as a point of extraction for air, dusts, and / or gases in areas where its accumulation is harmful, this depends on the user's specifications. It is a fabric duct with a support system of internal rings.

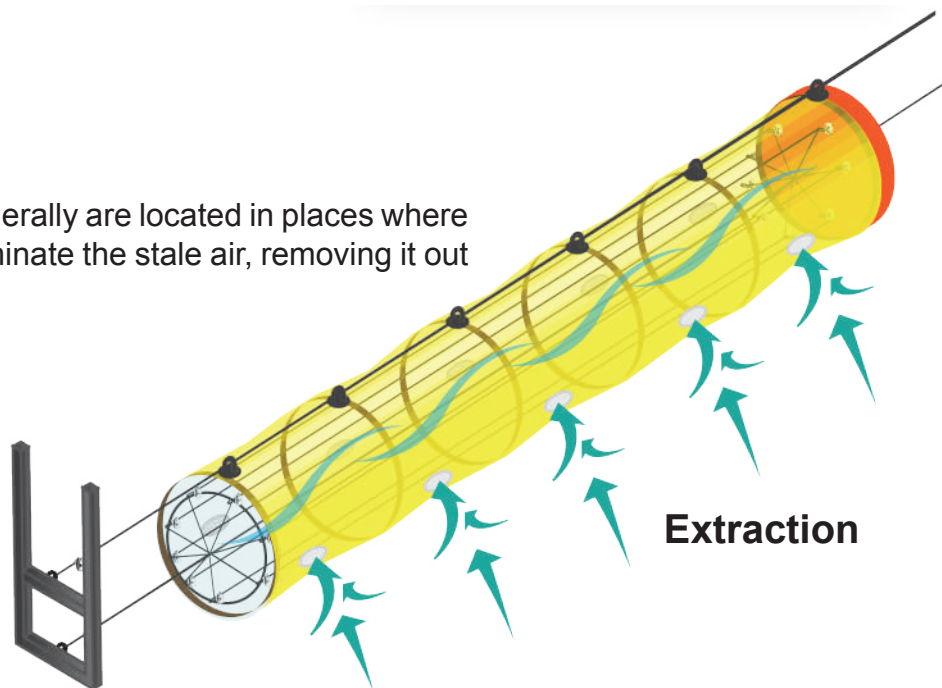

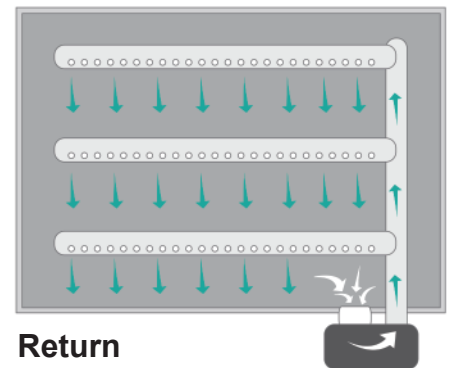

Benefits and advantages:

- Extremely simple to manufacture remove, move, adapt, clean and has very little weight.
- Aesthetic
- Low cost compared to metal systems.
- Adaptable to the dimensions desired by the client

Primary Features:

- Internal metal frame that prevents the system from contracting.
- Stainless steel tensor cables
- Internal rings with cross-piece.
- Collar
- Fasteners

The task of extraction air systems, which generally are located in places where there are no windows or ventilation, is to eliminate the stale air, removing it out of the room.
